```

The present sequence is a peptide which was inserted into expression vector pCANTAB5E to enable more flexible folding of the human eosinon derived neurotoxin protein (EDN), which was expressed by the vector. The protein can be directed to cancerous cells using additional N-terminal peptides, where it exerts a cytotoxic effect. The protein can, therefore

eosinophil

therefore

psoriasis and smooth muscle cell migration. Interferon alpha is a family of proteins which possess complex antiviral, antineoplastic and immunomodulating activities. Interferon alpha is effective against a variety of cancers including hairy cell leukaemia, chronic myelogenous leukaemia, malignant melanoma and Karposi's sarcoma. Multi-functional bioconjugates comprising both a vb 3 antagonists and interferon alpha 2b can exhibit greater biological activity when compared to a single factor or having improved half-life or decreased adverse side effects, or a combination of
                                                                                                                                             Bioconjugates comprising one or more a vb 3 antagonist moieties coupled to a peptide or polypeptide having anti-angiogenic properties can be used for treating a human patient with an angiogenesis mediated disease, e.g. cancer, arthritis, or macular degeneration. The a vb 3 integrin is normally associated with endothelial cells but can promote the formation of blood vessels (angiogenesis) in tumours. The a vb 3 integrin is also known to play a role in tumour metastasis, neoplasia, osteoporosis, Paget's disease, retinopathy, arthritis, periodontal disease, retinopathy, arthritis, periodontal disease.
                                                                                                                                                                                                                                                                                                                                                                  New bioconjugates comprising an avb3 antagonist and a metastatic-associated receptor ligand, useful for treating cancer and other angiogenic diseases, or as antiviral, antifungal or antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Biconjugate; a_vb_3 integrin; interferon alpha; angiogenesis; cancer; tumour; osteoporosis; Paget's disease; Karposi's sarcoma; periodontal disease; metastasis; peoplasia; retinopathy; arthritis; psoriasis; leukaemia; malignant melanoma; atherosclerosis; smooth muscle cell migration; inhibition; treatment; antagonist; angina; thrombosis; restenosis; antiviral; antifungal;

They can be used for inhibiting elevated levels of tumor antigens, inhibiting the proliferation of tumor cells and inhibiting tumor growth. The bioconjugates can also be used for treating e.g. osteoporosis, humoral hypercalcemia of malignancy, paget's disease, retinopathy including diabetic retinopathy, arthritis, including rheumatoid arthritis, periodontal disease, psoriasis, thrombosis, angina, atherosclerosis, smooth muscle cell migration and restenosis in a mammal. They are also useful as antivital, antifungal and antibacterial agents. This sequence is a peptide linker used in the construction of the multi-functional
                                                                    The present sequence represents a linker used in the construction of bispecific single-chain polypeptides of the invention. These polypeptides comprise domains providing binding-site of inmunoglobu chains or antibodies specifically recognizing CD19 and CD3 antigen. The polypeptide destroys CD19-positive target cells without any need of T-cell pre and/or co-stimulation, by recruiting cytotoxic T-lymphocytes and so specific lysis by T-cells rather than a direct effect by an antibody is achieved. The bispecific single-chain content of the present of the pres
polypeptides, or nucleotides encoding them, are used for the of B-cell malignancies, B-cell mediated autoimmune diseases myasthenia gravis, Morbus Basedow, Hashimoto thyroiditis o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (DOER/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
fusion protein. The invention relates to an isolated nucleic acid construct (I) comprising a region encoding an interleukin-12 (II-12) fusion protein (comprising an II-12 p35 subunit, an II-12 p40 subunit and I inker peptide (joining the subunits) and a region encoding a B7 protein. (I) may be used to produce II-12 fusion proteins according to standard recombinant DNA methodologies. The fusion proteins may be reduced either in vitro in a fermentation culture or in vivo as part of a gene therapy protocol (in this case (I) is used to transform a patients cells, which then secrete the functional polypeptide to supplement the CC patients own production of II-12 or to rectify mutations which lead to this way may be used to treat any disease which responds to II-12 such as tumours (both solid and dispersed of the kidney, breast, colon, ovarian and cervical tumours and melanomas) and in particular, tumours of the blood such as leukaemia. Alternatively, the polypeptides may be used as an antagonists of its activity. The antibodies and antagonists of company to the production of first bodies to II-12 and to assay for the used to inhibit the activity of II-12. (I) may also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

They can also delay the pathological conditions caused by these diseases, and can be used for detecting these diseases. The polynucleotide is used for gene therapy. The polypeptides are also used for identifying compounds modulating B-cell/T-cell mediated immune response with can in turn be used for treating cancer, its related diseases and also for inhibiting viral diseases by preventing viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid constructs encoding interleukin-12 fusion proteins useful for treating leukemia and other cancers -
                                                                                                                                                                                                                                                                                                         This sequence represents a linker that can be used in an interleukin-12 fusion protein. The invention relates to an isolated nucleic acid construct (I) comprising a region encoding an interleukin-12 (IL-12)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08-NOV-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             08-NOV-1996;

                                                                                            The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MHC) class II molecule and a second recombinant single chain MHC class II molecule, each comprising an alphal domain and a betal domain linked through an amino acid linker and a multimerisation domain. The first and the second molecule are linked through the multimerisation domain to form a multimeric complex. The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diagnostically as a probe which hybridizes to sequences encoding IL-12 and the antibodies may be used to detect the presence of IL-12 polypeptides in samples. They may be used diagnostically to quantitate the expression of the polypeptide by patients and hence which subjects may be in need of restorative therapy.
                                          multiple sclerosis, myasthenia gravis, pernicious anaemia, autoimmune encephalomyelitis (EAE), rheumatoid arthritis and systemic lupus erythematosus. The present sequence is a linker used to connect the

                                                                                                                             The present invention relates to a method for evolving a polynucleotide coward a desired functional property. The method comprising providing polynucleotides comprising two or more species variants, shuffling the polynucleotides to form a population of recombinant polynucleotides, selecting or screening for recombinant polynucleotides that have evolved toward the desired functional property, and repeating the steps to obtain the polynucleotide. The methods are useful for evolving a polynucleotide coward a desired functional property and for obtaining a recombinant polynucleotide having a desired functional property. The methods are also useful for generating and selecting nucleic acid fragments encoding mutant proteins. The methods are also useful in molecular backcross to eliminate unnecessary or silent mutations, in the study of repetitive DNA sequences and to mutate ribozymes and aptamers. The present sequence is spacer peptide used in the antibody display and screening methods.

                                                                                                                                                                                                                                                                                                           protein (ZFP) that modulates the expression of the molecular target, or isolating membranes from cell comprising ZFP. The methods allow for high throughput screening of candidate compound and reduces the incidence of false positives. The methods are useful for screening a compound for interaction with a molecular target or for screening a compound for its effect on a cellular process. The method is useful for testing a compound for its capacity to transduce a signal to the molecular target or its capacity to block transduction of a signal through the molecular target, and for performing biochemical drug-screening assays. The present sequence is a peptide linker used for linking ZFPs.
                                               AAU05172;
                                                                            AAU05172 standard; peptide; 5
                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of screening a compound for interaction with a molecular target. The method involves contacting first and second cells with the compound and determining the values of properties of the compound. The second cell comprises an exogenous zinc finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening compound for interaction with molecular target by contacting compound with cells, comprising exogenous zinc finger protein that modulates expression of target, and determining values of properties of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAE08730 standard; peptide; 5 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents the amino acid sequence of linker moiety #1 used to make a pain-relieving target construct. The construct comprises a pain-relieving agent linked to a ligand motety that selectively binds to or is taken up by the tissue associated with the painful interior disease site. The construct is used for treating pain associated with an interior disease site. Since the pain-relieving agent is delivered by the ligand to the disease site intractable pain situated in the interior of the body such as caused by various tumours, such as breast cancer, lung cancer, Hodgkin's and non-Hodgkin's lymphoma, and neuroblastoma, and ischaemic and diseased tissues can be managed using a lower level of the pain relieving agent than is required when the pain-relieving agent is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treatment of pain associated with an interior disease site, involves administering a pain-relieving target construct to the patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO200147512-A2

The construct comprises a pain-relieving agent linked to a ligand moiety that selectively binds to or is taken up by the tissue associated with the painful interior disease site. The construct is used for treating pain associated with an interior disease site. Since the pain-relieving agent is delivered by the ligand to the disease site intractable pain situated in the interior of the body such as caused by various tumours, such as breast cancer, lung cancer, Hodgkin's and non-Hodgkin's lymphoma, and neuroblastoma, and ischaemic and diseased tissues can be managed using a lower level of the pain relieving agent than is required when the pain-relieving agent is injected in the free state.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAG63011-14 represent peptide linkers used to produce a fusion protein, comprising neurotrophin-1 (NNY-1) and a soluble ciliary neurotrophic factor receptor alpha-chain (sCNTFRalpha) protein. The fusion protein is cused to prepare a medicament for the modulation of the activity of the CC used to prepare a medicament for the modulation of the activity of the CC immune, haematopoietic, nervous, or reproductive system, liver, bone CC or skeletal muscle cells. It is also used to make a medicament to C facilitate the proliferation or inhibit the differentiation of cloned CC cells, preferably embryonic stem cell clones. The fusion protein is CC also used as a medication for preventing or treating neurodegenerative CC disorders, for the repair or regeneration of nervous tissue or skeletal correct amylotrophic lateral sclerosis, Parkinson's and Huntington's CC disease, obesity and its related disorders, and cancer. The fusion CC prevent amylotrophic lateral sclerosis, Parkinson's and Huntington's CC disease, obesity and its related disorders, and cancer. The fusion CC protein may also be used to improve fertility, especially to prevent CC haematopoiesis, especially in treating thrombocytopaenia, and for the treatment of retinitis, especially rétinitis pigmentosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

The present invention relates to a chimeric protein which consists of at least two functional protein units where each protein unit comprises the dimerisation domain of a member of the steroid/thyroid hormone nuclear receptor superfamily. The protein units are linked by a linker peptide, and the two protein units form a functional entity. The invention includes a method for modulating the expression of an exogenous gene in an organism or cell containing the chimeric protein. The cell or organism also contains a DNA construct comprising the exogenous gene under the control of a response element with which the chimeric protein interacts. The response element controls the expression of the exogenous gene. The method also involves administering to the subject or cell an effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for enzymatically inactivating a target DNA using nucleases. The method comprises preparing a protein containing a nuclease domain, delivering the protein to human, animal, or plant, and enzymatically inactivating the target DNA. The nuclease related to the invention comprises a DNA binding domain that specifically binds to the target DNA. The method is used for enzymatically inactivating target DNAs such as human immunodeficiency virus (HIV), hepatitis B, herpes virus, polyoma virus and/or papilloma virus nucleic acids, and human, animal, viral and bacterial genes. The present sequence is a glycine linker which is used for the construction of clones producing the hybrid enzymes, e.g., ZF-Foki nuclease (FN) enzyme, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Steroid hormone; thyroid hormone; receptor; DNA binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         amount of an exogenous ligand for at least one functional unit of the chimeric protein. The chimeric protein is useful for modulating the expression of an exogenous gene in a subject organism. The present sequence represents a linker peptide which can be used in the construction of the chimeric protein of the invention.
                                                                                                                                       The present invention relates to a method of identifying a bioactivity or biomolecule of interest, involving introducing a labeled substrate and a recombinant clone into a capillary tube of a capillary array, culturing the tube to allow the substrate and clone to interact and provide a detectable signal and detecting the signal to identify the capillaries containing the activity or molecule of interest. This can be used to identify enzymes for use in the biotechnology and chemical industries, and in drug discovery, particularly of antibacterial compounds. The present sequence is a linker peptide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

                                                                                                                                                                                                                                         This invention relates to a fusion protein consisting of two water soluble pyrroloquinolinequinone glucose dehydrogenase (PQQGDH) subunits derived from Acinetobacter calcoaceticus, bound via a linker peptide. The fusion protein is used for quantitative determination of glucose in clinical samples and foods. The present sequence represents a linker peptide which forms part of the fusion protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        JP2001037483-A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method of enhancing the efficacy of an agent by coadministering the agent and a context-dependent functional entity. The latter comprises a substructure with thrombogenic potential and a selective recognition domain. This is useful in the treatment of cancer, arthritis, infections, neovascular glaucoma, inflammatory conditions, dermatitis, endometriosis, atherosclerosis, vascular restenosis and conditions associated with granulation tissues, such as burns and pyogenic granuloma. The present sequence is an example of a spacer peptide for use in the invention.

                                                                                                            a fluorescent protein indicator. The indicator comprises a sensor polypeptide that is responsive to a chemical, biological, electrical or physiological parameter, and a fluorescence protein functional group. The sensor polypeptide is operatively inserted into the fluorescent moiety. The fluorescent indicator is useful for detecting the presence of a response inducing member in a sample. The method involves contacting the sample with the indicator and detecting a change in fluorescence, in which a change is indicative of the effect of the parameter on the sensor polypeptide. The novel fluorescent proteins are advantageous due to their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for producing a population of transgenic plants, comprising transforming intact plant cells with minimal transgene expression cassettes by direct DNA transfer techniques, and regenerating a population of transgenic plants from transformed plant cells. The present sequence is a linker peptide, which can be used in the expression cassette of the present invention.

                                                                                                             The present invention relates to a new method for modulating a biological function of an endothelial cell or hematopoletic cell. The method involves introducing into a cell, an antagonist that inhibits binding between a PDZ protein and a PL protein. The inhibitor is used to treat a disease mediated by hematopoletic cells, e.g. autoimmune disease. It may also be used to prevent transplantation rejection of a solid organ transplant. The method may also be used in the treatment of inflammation, allergy, inflammatory bowel diseases, ulcerative colitis, ileitis, psoriasis, asthma, atopic dermatitis, autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, insulin-dependent disease, Hashimoto thyroiditis, osteoarthritis, graft rejection, transplantation rejection), atherosclerosis, cancers, infectious diseases, ischemia, vasulitis and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14-MAY-1999;

CC prototypical proteins: PSD95, Drosophila large disc protein and Zonnla CC Occludin I protein. PDZ domain proteins are involved in synapse formation by organising transmembrane neurotransmitter receptors through contracted lular interactions. The inhibitors identified by the present invention can be used to treat a disease mediated by haematopoietic convention can be used to treat a disease mediated by haematopoietic convention can be used to treat a disease mediated by haematopoietic configuration and the present structure of the present convention of allergies), inflammatory bowel diseases, ulcerative colitis, lieitis, conventions, autoimmune diseases (e.g. asthma), atopic conventitis, autoimmune diseases (e.g. rheumatoid arthritis, multiple conventitis, autoimmune diseases (e.g. rheumatoid arthritis, multiple conventitis, autoimmune diseases, Hashimoto thyroiditis, conventitis, atherosclerosis, cancers, infectious disease. The conventition of a solid organ transplant. The present sequence is a flexible polylinker cused in the construction of fusion polypeptides of the PDZ-PL

         The present invention relates to a method for modulating a biological function of an endothelial cell or haematopoietic cell, comprises introducing into a cell an antagonist that inhibits binding between a PDZ domain protein and a PL domain protein to result in inhibition of leukocyte activation. PDZ domains of proteins are named after three prototypical proteins: PSD95, Drosophila large disc protein and Zonula Occludin 1 protein. PDZ domain proteins are involved in synapse formation by organising transmembrane neurotransmitter receptors through intracellular interactions. The inhibitors identified by the present

The inhibitors can also be used to prevent transplantation rejection of a solid organ transplant. The present sequence is a flexible polylinker used in the construction of fusion polypeptides of the PDZ-PL
                        The present invention describes a chimeric bifunctional molecule (I) comprising at least a first functional molecule covalently linked to a second functional molecule, which is able to modulate the activity of the permeability transition pore complex (PTPC) of the mitochondria.

(I) has the function of specifically targeting and entering a tissue cell population. The second functional molecule has the function of specifically targeting and inducing or preventing the death of the cells by apoptosis by regulating the opening or the closing of the PTPC of the mitochondria or its fragment. (I) has virucide, neuroprotective,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          allergies), inflammatory bowel diseases, ulcerative colitis, psoriasis, respiratory allergic diseases (e.g. asthma), atopi dermatitis, autoimmune diseases (e.g. rheumatoid arthritis, m sclerosis, insulin-dependent diabetes, Hashimoto thyroiditis,
                                                                                                                                                                                                                                                                                                                                                                                                          New chimeric bifunctional molecules that target specific cells regulate the apoptosis function of the permeability transition complex of the mitochondria, useful for treating or preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             permeability transition pore complex; virucide; neuroprotective; vasotropic; cytostatic; infection; cell death regulation; apoptosis; mitochondrial permeability transition pore complex modulator; cancer; apoptogenic; ischaemia; neurodegenerative disease; fulminant hepatitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   permeability transition pore complex (PTPC) modulator. (I) is useful for treating or preventing a pathological infection or disease. (I) is also useful for regulating cell death regulatory molecules, specifically the apoptogenic function of the PTPC, for treating e.g. cancer, ischaemia, neurodegenerative diseases, fulminant hepatitis or viral infections. The present sequence represents a linker peptide which is used in an
                                                                                                                                to display one or more heterologous peptides or proteins. The baculovirn is useful for the delivery of a peptide or protein into the nucleus. It is also useful in libraries (genomic or CDNA) and peptide displays, particularly in selecting target genes, in the functional analysis of genes and their products, or screening these libraries. The present sequence is a linker peptide used in the invention.
                                                                                                                                                                                                                                                                      New engineered baculoviruses, useful for the delivery of proteins into the nucleus, libraries or peptide displays, e.g. in selecting target genes, comprises capsids modified to display heterologous proteins -

                                                                                                                        RESULT 35
                                                                                                                                                                                                                                                                                                                     The present invention relates to methods and compositions for identifying CC a gene. The method involves contacting a cell comprising a putative gene CC sequence (PGS) with an exogenous molecule that binds to and modulates the expression of the PGS, and assaying the cell for at least one selected phenotype, where if one or more of the selected phenotypes are observed. CC the PGS is identified as a gene. The methods include the use of exogenous molecules such as zinc finger proteins (ZFPS) which are capable of CC binding to and modulating expression of gene transcription, targetted to CPGS, followed by assay of one or more selected phenotypes. The ZFPS are CC useful for determining the phenotypic consequences and function of gene expression. The method is useful to explore biological processes such as cransformation, tumour progression, inflammatory response, neurological components, etc. The method can very rapidly identify genes that are up or CC down-regulated in different tissues or in response to specific stimuli.

CC The present sequence is a linker peptide used to link two zinc finger proteins. This peptide is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                              size of the tissue that needs to be removed. It can also be used to detect infections (bacterial, viral or fungal), pre-cancerous states, heart attack, stroke and necrotic or ischaemic conditions (all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       administered to the subject and which has specifically bound to and/or been taken up by the diseased tissue; and determining the location and/or surface area of the diseased tissue from the fluorescence provided by the targetting construct. The ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of a flexible spacer peptide linker that can be used to link a fluorescent molety to a ligand molety in fluorescent targetting constructs of the invention. A claimed method for in vivo diagnosis of diseased tissue involves: irradiating a body part with light having at least one excitation wavelength of 401-500 nm, directly viewing fluorescence emitted in response to light from a fluorescent targeting construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     In vivo diagnosis of diseased tissue, useful e.g. for defining extent of tumors during surgical resection, based on fluorescence from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-OCT-1998;

                                                                                                                                                                                                                                                                                                                                                                                      moiety is especially a tumour-avid moiety. The method is especially used to diagnose any of a wide range of tumours (melanoma, insulinoma, pancreatic tumours, pancreas or adrenal cell lung cancer, lymphoma, or ovary, pituitary, pancreas or adrenal cancer, brain tumour, colorectal cancer, cutaneous melanoma, epithelial cancer, lung carcinoma, testicular germ cell tumour, or breast cancer), especially during surgery to define the outline and size of the tissue that needs to be removed. It can also be used to detect infections (bacterial, viral or fungal), pre-cancerous states, heart attack, stroke and necrotic or ischaemic conditions (all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a flexible spacer peptide linker that can be used to link a fluorescent moiety to a ligand moiety fluorescent targetting constructs of the invention. A claimed method for in vivo diagnosis of diseased tissue involves: irradiating a body part with light having at least one excitation wavelength of 401-500 nm; directly viewing fluorescence emitted i response to light from a fluorescent targeting construct administered to the subject and which has specifically bound to and/or been taken up by the diseased tissue; and determining the location and/or surface area of the diseased tissue from the fluorescence provided by the targetting construct. The ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     In vivo diagnosis of diseased tissue, useful e.g. for defining extent of tumors during surgical resection, based on fluorescence from a specifically bound targeting construct -

Molecular antigen array; vaccine; antigen; antimicrobial;

```
The invention relates to a composition comprising: (a) a non-natural CC molecular scaffold comprising: (i) a core particle effected from: (CC (1)) a core particle of a non-natural origin; and (2) a core particle of trattal origin; and (1) an organiser comprising at least one first CC attachment site, where the organiser is connected to the core particle by at least one second attachment site, where the antigen or antigenic determinant with CC attachment is amyloid beta peptide (Abeta 1-42) or its fragment, and CC where the second attachment site is selected from: (i) an attachment site on the second attachment site is selected from: (i) an attachment site on the second attachment site is selected from: (i) an attachment site of association through at least one non-peptide bond to the first attachment site; and where the antigen or antigenic determinant; and cocurring with the antigen or antigen or antigen or antigen or antigen or antigen or antigen or antigen array. Its composition is used interact through the association to form an ordered and repetitive cocurring ordered and repetitive antigen array. The composition is used in immunisation and as a vaccine for diseases such as influenza, acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, Grave's casthma, acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, Grave's casthma, acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, Grave's casthma, acute lymphablastic leukaemia, non-Hodgkin's lymphoma, Grave's casthma, acute lymphablastic leukaemia, non-Hodgkin's lymphoma, Grave's casthma, acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, Grave's casthma, acute lymphoblastic leukaemia, hon-Hodgkin's 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19-JAN-2001;

                                                                                                                                    The present invention relates to novel immunoglobulin molecules that bind to kinase insert domain-containing receptor (KDR) (a human homologue of mouse foetal liver kinase (FLK)-1 receptor) with an affinity comparable to human vascular endothelial growth factor (VEGF) and that neutralises activation of KDR. Sequences of the invention are useful for neutralising the activation of KDR, for reducing tumour growth and for inhibiting angiogenesis. The present sequence is a linker peptide used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used in the molecular antigen array.
                                                                                                                        angiogenesis. The present sequence single chain (scFv) antibodies.
                                                                                                                                                                                                                                                                            Novel immunoglobulin molecule for reducing tumor growth, binds to kinase insert domain-containing receptor with an affinity comparable human vascular endothelial growth factor, and neutralizes activation

                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                        The invention relates to methods and reagents for determining the apparent affinity (Kd) of binding between a PDZ domain and a ligand. The invention also relates to methods and reagents for determining the Ki of an inhibitor of binding between a PDZ domain and a ligand, identifying an agent that enhances binding of a PDZ domain and a ligand, and determining the potency (K-enhancer) of binding between a PDZ domain and a ligand, by determining the ligand bound with an immobilised polypeptide comprising a PDZ domain and an on-PDZ domain on a surface. The modulator (preferably, an inhibitor) of interaction between PDZ and PL is useful for treating a disease characterised by leukocyte activation, e.g., an autoimmune disease that is characterised by inflammatory or humoral immune response, and for reducing inflammation in a subject. This sequence represents a peptide linker of a VH and VI antibody relating to the PDZ domain peptides and ligands of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assays for determining the affinity of binding between a PDZ domain a ligand, and determining the Ki of an inhibitor of the binding, comprises using a polypeptide comprising a PDZ domain and a non-PDZ
         Binding domain-immunoglobulin fusion protein associated linker

                                                                                                                                                                                                                                   erythematosus, Sjogrens syndrome, immune thrombocytopenic purpura, psoriasis, scleroderma, cancer and inflammatory bowel disease such as Chron's disease and ulcerative colitis. The fusion protein retains the ability to participate in well known immunological effector activities including antibody dependent cell mediated cytotoxicity and/or complement fixation in complement dependent cytotoxicity, despite having structures that would not be expected to be capable of promoting the effector activities. It can be produced in substantial quantities that are typically greater than those routinely attained with single-chain antibody constructs. This sequence represents a linker peptide used
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a binding domain-immunoglobulin fusion protein that is capable of at least one immunological activity, comprising a binding domain polypeptide fused to an immunoglobulin hinge region polypeptide capable of specifically binding to an antigen, or an immunoglobulin heavy chain CH2 or CH3 constant region polypeptide fused to the hinge region polypeptide or to the CH2 constant region polypeptide. The fusion protein is useful for treating a subject having or suspected of having a B-cell disorder or malignant condition e.g. rheumatoid arthritis, myasthenia gravis, Grave's disease, Hashimoto's thyroiditis, type I diabetes mellitus, multiple sclerosis, systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           neuroprotective; gene therapy; single chain antibody; variable fragment; scFv; binding domain-immunoglobulin fusion protein; B-cell disorder; malignant condition; rheumatoid arthritis; myasthenia gravis; psoriasis; Grave's disease; Hashimoto's thyroiditis; type I diabetes mellitus; multiple sclerosis; systemic lupus erythematosus; Sjograns syndrome; multiple sclerosis; systemic lupus erythematosus; Sjograns syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human binding domain-immunoglobulin fusion protein useful for treating a subject having or suspected of having a B-cell disorder malignant condition e.g. rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immune thrombocytopenic purpura; scleroderma; cancer; Chron's disease; ulcerative colitis; inflammatory bowel disease; immunological effector; cell mediated cytotoxicity; complement dependent cytotoxicity;
